

Factsheet  
URequire

## Natural language in a dynamic environment

**Requirements are often complex. Capturing, understanding and analyzing these requirements costs a lot of time. In addition, Business and IT appear to be speaking two different languages. These differences increase the risk of miscommunication and mistakes. URequire provides the solution.**

### What is URequire?

URequire is the solution for capturing, making available and managing high quality business requirements. The result: clear and concise requirements, without any loss of information.

### Why URequire?

- Easy to use
- Requirements coach
- Smart navigation
- Universally applicable
- Stay in charge
- Know about changes in your requirements
- Track-and-trace

### Easy to use

You continue to work the way you are used to, so you lose no time with learning and understanding new procedures. At the same time, with URequire you have access to the professional methods as defined in SBVR 1.0. To ensure that the best use is made of all the features of URequire, we provide a short introduction.

### Requirements coach

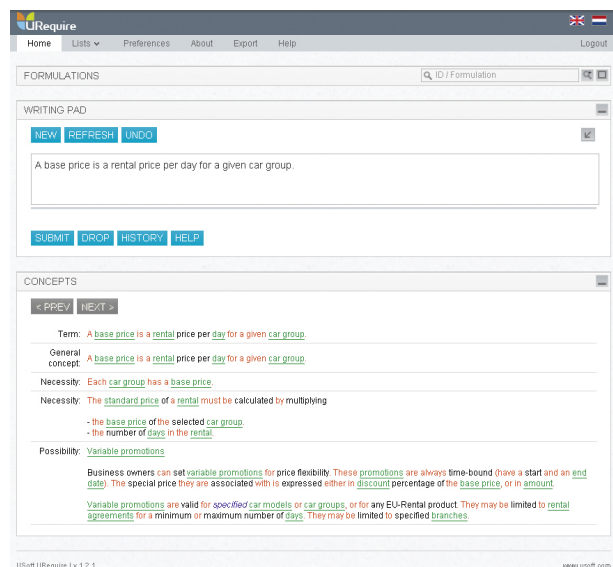

You are provided with assistance to capture requirements in a clear and concise manner, but you decide whether a requirement is specific enough for its purpose. URequire unites two worlds: computer software and the human brain. While you are defining and specifying requirements, URequire is taking care of the administrative tasks for you. It structures requirements and concepts, and keeps track of what yet needs to be defined. When you enter a new or existing concept, all relevant information is displayed on the screen. URequire provides you with an efficient method for capturing and managing high quality requirements.

### URequire advantages:

- No ambiguity. URequire identifies ambiguous requirements, so you can decide whether to take action or not.
- Consistent requirements. You can assess requirements for duplicated definitions at a glance.
- Completeness. The color coding reveals the undefined concepts.

### Smart navigation

The requirements that need change or specification are detected easily thanks to the structure that URequire brings to the requirements. Related requirements are automatically grouped. At the click of a button you see everything associated with a concept in one place. The structure allows easy searching and navigation across the whole system. With the grouping, navigation and search functions, URequire provides an ideal environment for you to do your job, without disturbing the process.

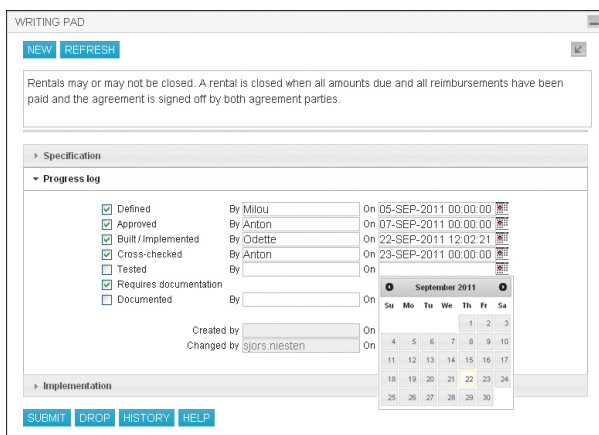

### Universally applicable

- You can describe organizations and IT systems with URequire.
- You can describe existing and new situations with URequire.
- Requirements can be used in a functional and efficient manner by all departments. Technical jargon no longer plays a part.

### Stay in charge

With the features offered by URequire, you stay in charge. URequire keeps an up-to-date record of the requirement's current status. At any time, you can check whether a requirement has been tested or approved. In this way, URequire makes progress measurable, providing you with complete control over the process and the ability to make targeted decisions on follow-up steps.

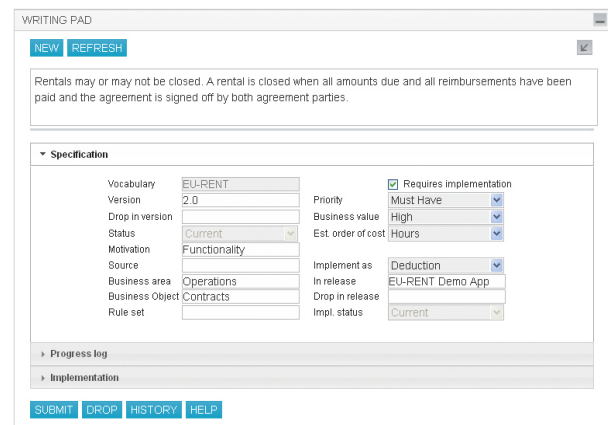

### Know about changes in your requirements

You can easily access and view the URequire history manager. Every change in the requirements is logged. Over time you gain a log of changes across different versions of your IT solutions. There is no need to create extra documentation to keep this information safe.

### Track-and-trace

URequire offers the possibility to qualify and group your requirements. Track-and-trace your requirements easily by specifying additional BRM (Business Rule Management) characteristics. For example, by specifying the vocabulary it belongs to, its origin, priority, business value, and implementation status. Also, you can monitor the progress of all your business requirements by specifying who defined, approved, built and tested them, and when.

### About USoft

Usoft is a Dutch Independent Software Vendor well known for its Language Based Business Process Management Suite that enables clients to keep up with business demands without lowering standards.

Usoft helps to bridge the gap between Business and IT using Natural Language to capture and manage requirements, laying a solid foundation for expanding and optimizing organizations.
