

Factsheet
UDesign

Your Business Processes Visualized

Get a head start in process improvement with easy to use visual process models. Usoft offers several tools and methodologies to model, execute and manage the sequence of activities in a business process.

What is UDesign?

UDesign is a state of the art tool for modeling all business processes and activities, with options for managing your business activity on the basis of processes.

Why UDesign?

- Easy to use
- Your business processes 100% clear and visible
- No installation required
- Integrates requirements, rules, and processes
- Easy connection to rules and process engines (Enterprise version)
- Error detection and prevention. You are supported by visual consistency checks if you attempt to design process steps that are not valid.
- Cost and duration based simulation of processes
- Conforms to latest standards

Easy to use

UDesign offers an easy to learn intuitive graphical user interface, which enables users to manage complex business process models. UDesign Studio automatically translates your process model into natural language, and offers a cross-reference to your company's requirements base.

Business processes clear and visible

UDesign guarantees 100% visibility of your business processes. In combination with the Usoft process engine this ensures complete control of all business processes. Business activity is managed on a begin-to-end, value-added basis.

No installation required

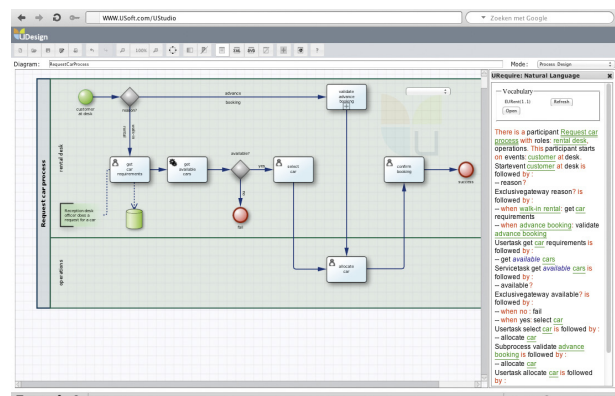

UDesign is a web-based Software as a Service (SaaS) solution. This offers many advantages.

SaaS advantages:

- Processes can be viewed from any location.
- New versions are automatically updated.
- You do not have to bother with installation issues.
- Latest technologies are used. Underlying technologies are HTML5 and SVG (Scalable Vector Graphics). Currently, the following browsers are supported: Opera, Chrome, and FireFox

Integrates requirements, rules, and processes

Processes involved with automated systems must be able to adapt rapidly to changes. To simplify change management, the Studio version integrates the management of requirements, rules and processes.

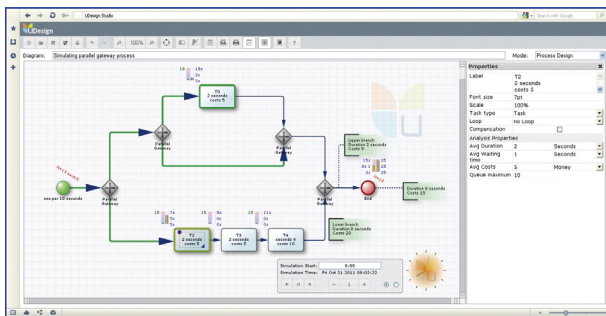

Easy connection to rules and process engines

Usoft bridges the gap between business processes and the design of information and knowledge systems. A UDesign process diagram can represent an executable process. Usoft offers tools to manage and run such executable process diagrams. The Usoft process engine assists and eases the collaboration between all your business parties.

Cost and duration based simulation of processes

UDesign offers a visual representation of a process run where costs, waiting times, duration and maximum queue lengths can be varied to show you the impact of changes in your process flow. This allows you to optimize your processes easily.

Conforms to Latest Standards

Process modeling with UDesign is based on the BPMN 2.0 OMG (Object Management Group) world standard. UDesign provides visual representations of all business processes using process diagrams in BPMN 2.0 notation. Events, activities, gateways, participants and lanes are the main building blocks. Process diagrams can be exported in XML format and SVG (Scalable Vector Graphics) format.

About Usoft

Usoft is a Dutch Independent Software Vendor well known for its Language Based Business Process Management Suite that enables clients to keep up with business demands without lowering standards.

Usoft helps to bridge the gap between Business and IT using Natural Language to capture and manage requirements, laying a solid foundation for expanding and optimizing organizations.

With over 20 years of experience in delivering added value for its clients, Usoft continues to explore new ideas and technologies. Using a mix of experienced professionals and great technology, Usoft can ensure a profitable combination of growth and stability.
